Agentic End-to-End Software Development Workflow

Software Development with AI agent end-to-end support, AFK methodology and agents orchestration

Dr. Han Yang

Agenda

Software Development with **AI agent** end-to-end support

Demo

Software developer main task in **AI agent** era

Memory support **AI** personal assistant

AI Agentic Workflow

FDE for **AI** agentic end-to-end

Development team culture in **AI agent** era

Tips

Our Lifecycle Shifts

AI agents transition production from manual labor to high-integrity automated delivery.

Maintenance & Resolution

Bug fixes and routine maintenance handled via AI-guided diagnostics to minimize downtime.

Architectural Enhancements

Agents assist in continuous refactoring and improvements for high-quality software architecture.

AFK Implementation

The AI executes the "Away From Keyboard" method, creating production code.

Analysis & Spec

AI skills translate financial requirements into actionable specifications.

Demo

Engineers now master **AI agents** **orchestration** over coding

The primary daily output is now clean, high-quality specifications that AI agents can translate into high-quality production code.

Specifications is the Code

The primary daily output is now specs that AI agents translate into production code.

Prompt and Skill

Fine-tuning

Enhance skills and prompts to align with company standards of code conduct and responsibility.

Workflow Orchestration

Managing interaction between AI agents to create a seamless, end-to-end development pipeline.

A Second Brain AI agent

Memory-supported AI agents remember your context, decisions, and preferences to personalize every single interaction.

Persistent Memory

Obsidian keeps context and decisions across sessions, so knowledge compounds.

Personal Assistant

Each person gets a tailored agent that knows their projects, standards, and history. AI agent Microsoft 365 plugin will provide AI support on daily work.

Shared Knowledge

A shared Second Brain captures team expertise, so onboarding is effortless.

AUTOMATION

Three ways to automate

Forward Deployed Engineers for AI agents

1

Train AI Agent Experts

Develop specialized expertise in AI agent frameworks and model training.

2

Embed With the Team

Integrate components directly into the client squad to ensure alignment.

3

Build & Integrate

Develop and snap-in modular solutions into the existing tech ecosystem.

4

Bridge to the RheinWeg

Finalize integration and establish the path for sustained

Foster a Culture of the **AI agent era** - 1

Foster a Culture of **AI agent era - 2**

Pragmatic Execution

Prioritize modular components that deliver immediate, measurable utility over over-engineered builds.

Radical Openness

Maintain a transparent ecosystem where code and decisions are shared to accelerate collective learning.

Frictionless UX

Design snap-in workflows that minimize complexity for the end-user while maximizing system performance.

Tips for Claude Development

Restart Claude

Save tokens,
avoid
hallucinations.

Use /handoff

Export
content to
docs as

Plugins and hooks

Leverage
Caveman, rtk
for tokens.

Prompt generation

Let the LLM
generate the
prompt.

Testing

Use unit/e2e
tests for
stability.

Git workflow

Use Git
worktrees or
branches.

Use a container

Run AFK in a
container.

Manage plugins

Disable
unused
Claude
plugins.

Vision of next **AI era development**

Thank you for the discussion on the vision of next AI era development
